EXAMINER'S AMENDMENT

Summary

1. This is in response to an amendment/response filed on April 28th, 2009.
2. No claims have been amended.
3. No claims have been cancelled.
4. No new claims have been added.
5. Claims 1-5, 7, 8, 10-12, and 14-16 are allowed.

Reasons for Allowance

6. The following is an examiner's statement of reasons for allowance:
7. For independent claim 1, the prior art fails to show alone or in combination a mobile data wireless relay device including a status data generation means for generating, receiving, and transmitting status data, the status data being derived from the quantity of data in the buffer store and the status data received from other devices comprising data relating to: the position of the device, the quantity of data in the buffer store, a scalar forwarding value, and a forwarding direction; and further including "means for defining a first node and a second node, the nodes being spaced apart by a distance determined by the amount of data stored in the buffer, the first node being assigned a positive value for an attribute q and the second node being assigned a negative value for the attribute q, equal in magnitude to that assigned to the positive node."

The prior art of Lipasti et al. (U.S. Patent Application Publication 2002/0039357) disclose a method for routing packets in a mobile ad-hoc network. Packet routing is

accomplished by composing additional source and destination routing addresses from network layer addresses or unique device identifiers and selecting the appropriate next hop interface. The prior art of Billhartz (U.S. Patent 7,027,426) disclose a mobile ad hoc network that sends a route request for each of the plurality of channels to discover routing to a destination node.

However, neither Lipasti et al. and Billhartz fail to disclose generating, receiving, and transmitting status data that is derived from the quantity of data in the buffer store and the status data received from other devices comprising data relating to: the position of the device, the quantity of data in the buffer store, a scalar forwarding value, and a forwarding direction. Lipasti et al. and Billhartz further fail to disclose a “means for defining a first node and a second node, the nodes being spaced apart by a distance determined by the amount of data stored in the buffer, the first node being assigned a positive value for an attribute q and the second node being assigned a negative value for the attribute q, equal in magnitude to that assigned to the positive node.” Independent claims 8 and 10 are allowable for similar reasons. Dependent claims 2-5, 7, 11, 12, and 14-16 are allowable because they depend on the allowed claims.
